

Aligning Service-Oriented Architectures with Security Requirements

Mattia Salnitri

Fabiano Dalpiaz

Paolo Giorgini

Software Evolution

- It affects all software systems
- From a software engineering perspective what may evolve are:
 - Software architectures:
 - due to technical changes (e.g.: a component is dismissed);
 - due to technical prerequisites (e.g.: new version of the O.S.).
 - Software requirements:
 - The needs of the Stakeholders may change;
 - Laws and norms may change.

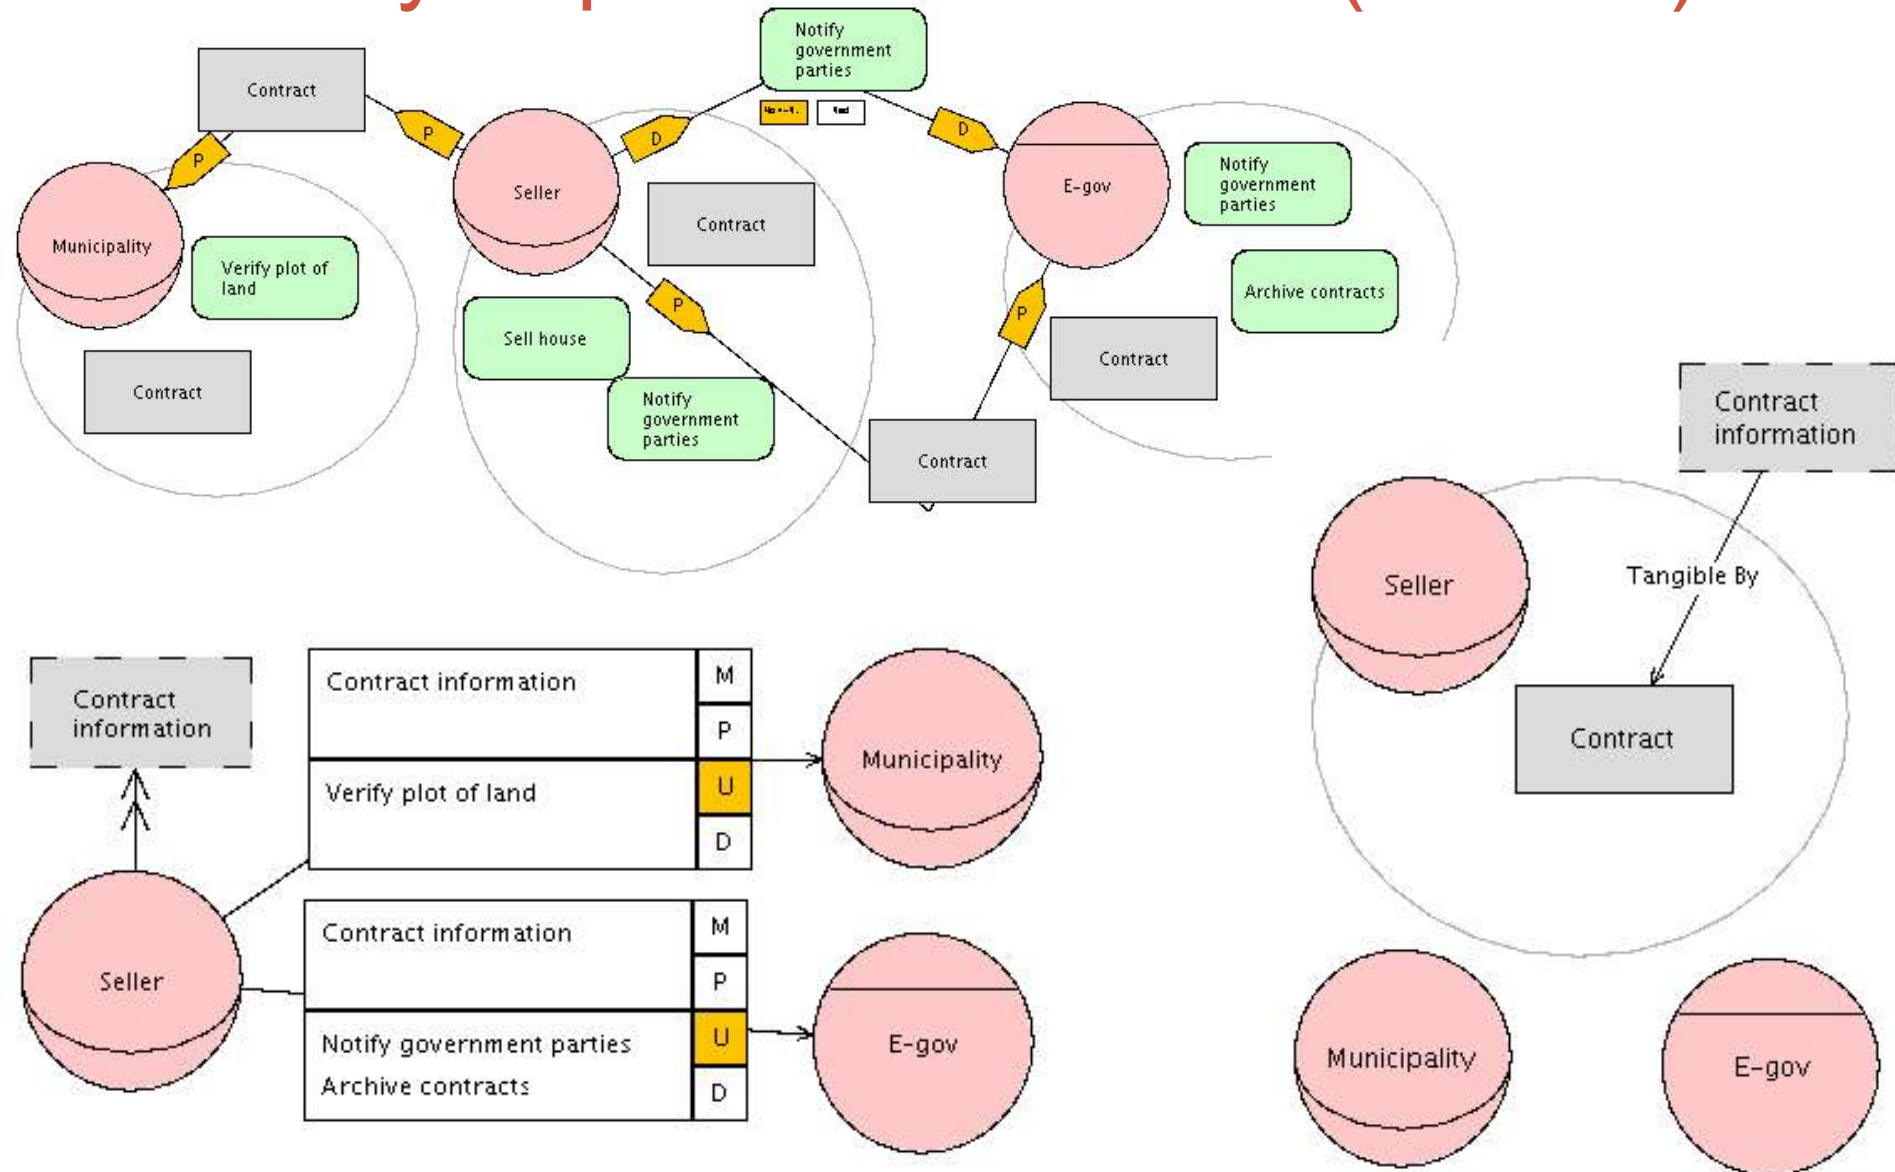

Requirement-Architecture Alignment

- Evolution may lead architecture and requirements to diverge.
- If they are not aligned, it means the requirements are not fulfilled
 - The system does not do what it is expected to do!
- Keeping an architecture aligned with requirements is a key process in the era of (software) evolution

Security requirements...

- We focus on security requirements
 - If violated they have severe consequences
 - Law compliance
 - Loss of money
 - Examples
 - Integrity : Ensuring that information is not accessed by unauthorized persons [1]
 - Confidentiality : Ensuring that information is not altered by unauthorized persons in a way that is not detectable by authorized users [1]
- We model security requirements with commitments
 - Using STS-ml approach [2]

Security requirements models (STS-ml)

Security requirements specification (SRS)

Security requirements:

C(eGov application, Seller, D=delegation(Seller, eGov application, Government notified), non-rep(D))

C(e-Gov application, Seller, T, non-disc(Municipal approval \wedge Sale information))

C(Municipality, Seller, T, non-discl(Sale information))

...

Knowledge base:

part-of(Land details, Sale information)

part-of(Price, Sale information)

...

tangible-by(Sale information, Official contract)

tangible-by(Sale information, Contract draft)

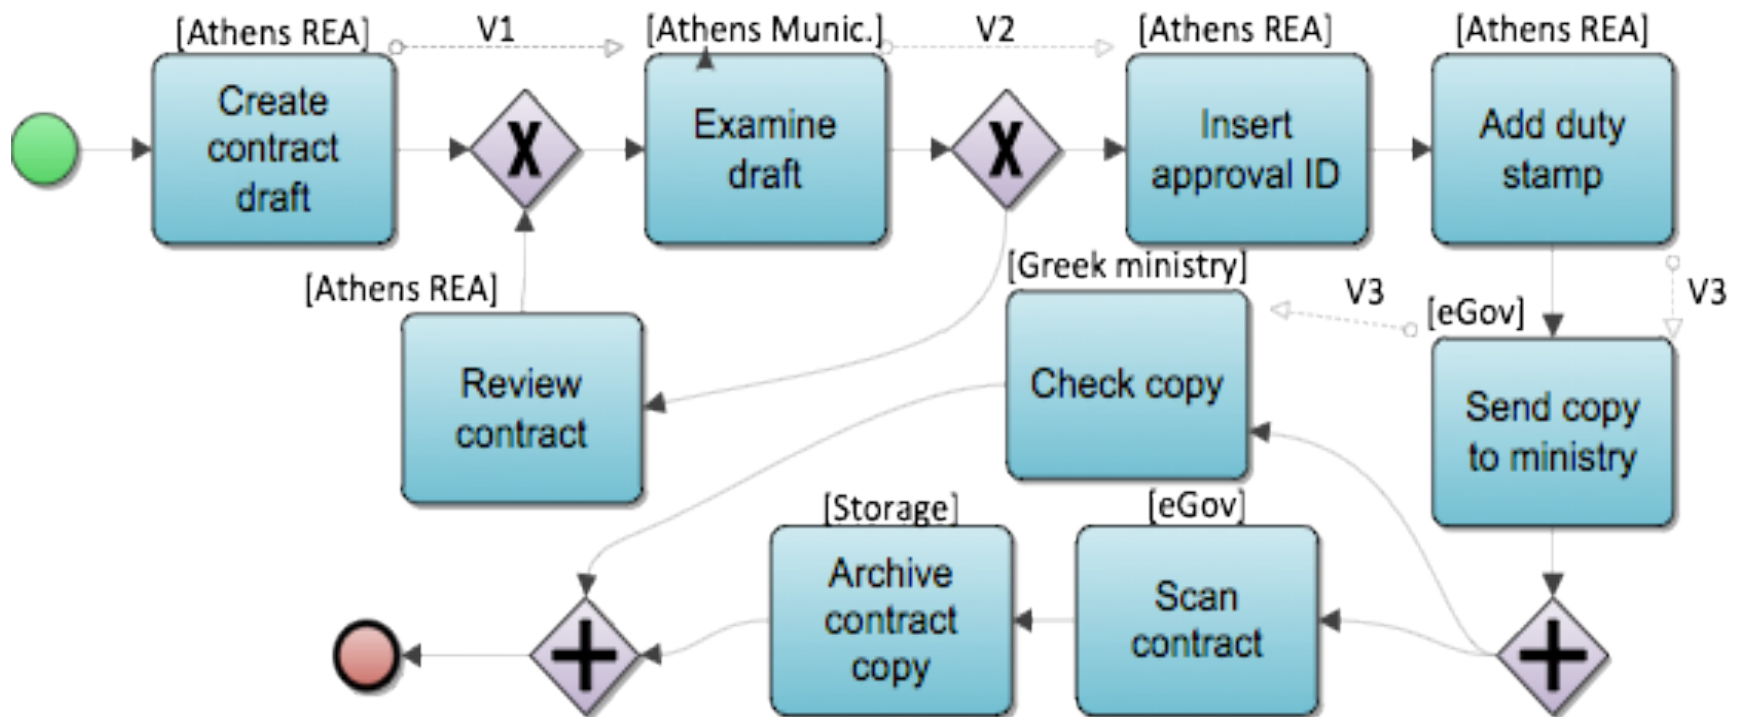

...

owns(Seller, Sale information)

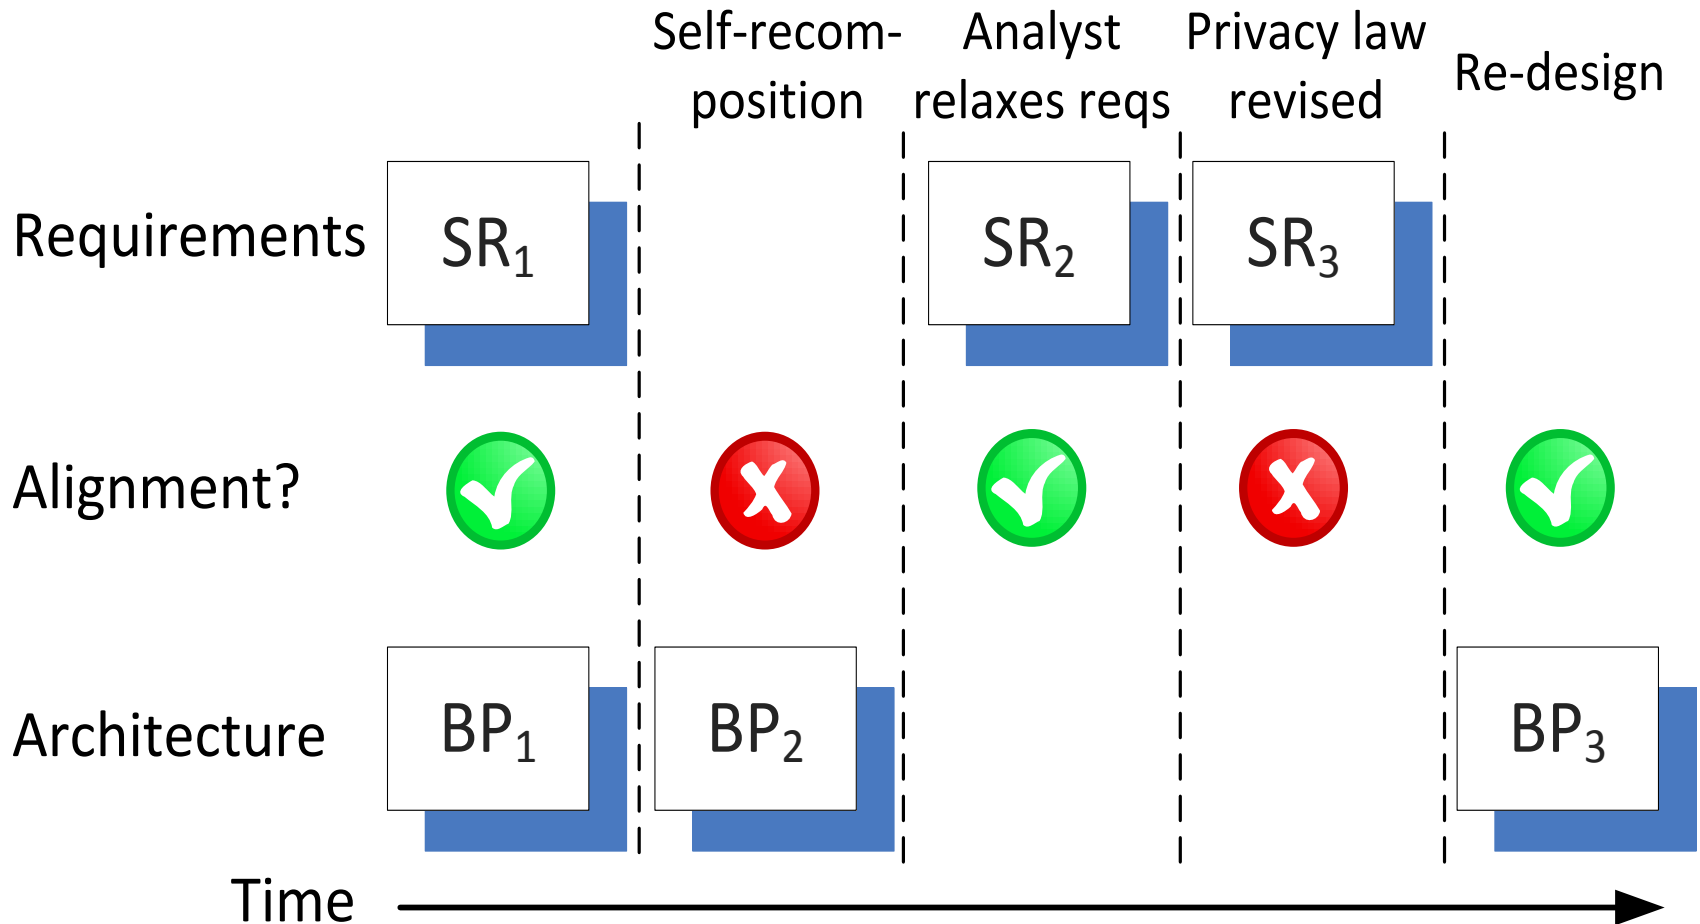

...and Service Oriented Architectures

- Service Oriented Architectures
 - Services provide functionalities to third parties
 - Evolution is intrinsic in services
- Service compositions
 - Used to describe the architecture of a set of interrelated services
 - Modelled as business process models(BPMN)

Service composition (eGov scenario)

Requirement-Architecture Alignment

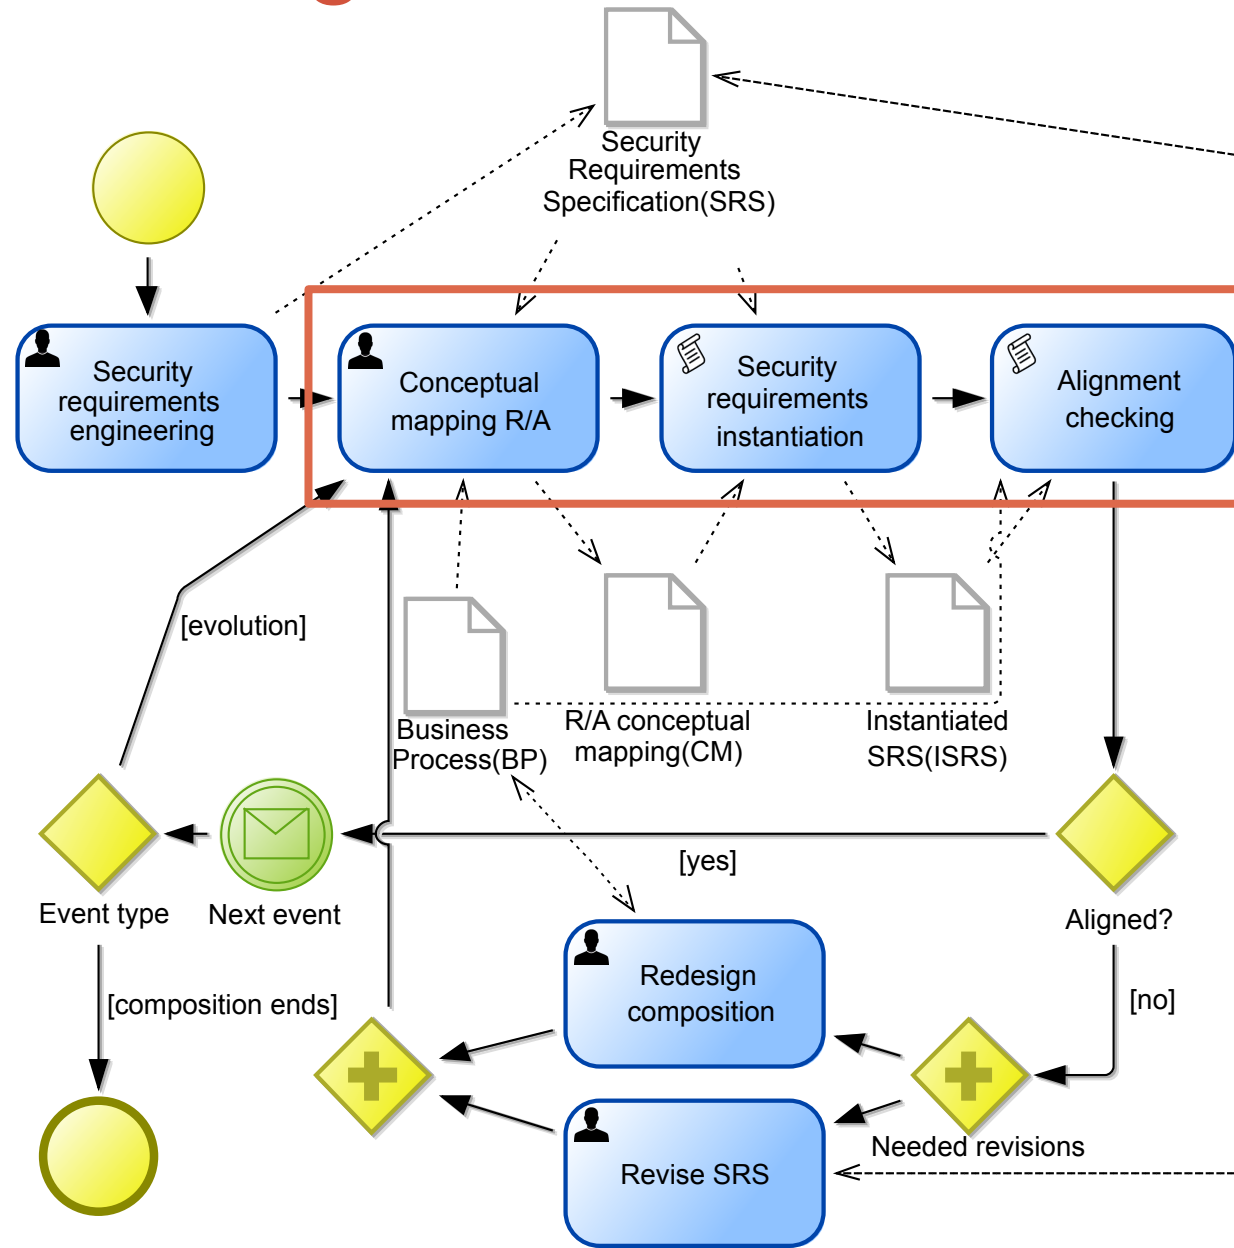

Objectives

- Define a methodological approach which permits the analyst to check the compliance (alignment) between security requirements and service composition
 - Define the conceptual mapping between security requirements elements and service composition elements
 - Automated algorithms to check compliance

Conceptual mapping

BPMN Element	Relation	STS-ml Element
Participant	is-a	Actor
Activity	relates-to	Goal
Variable (Data object)	represents	Information

Methodological framework

Example: Non-disclosure

- Suppose to check the security requirement:
 - C1:C(eGov application, Seller, T, non-disc(Sale information))
- With the business process described above

Example: Non-disclosure

BPMN element	relation	STS-ml element
eGov	IS-A	eGov application
Storage	IS-A	eGov application
Athens REA	IS-A	Seller
V1	Represents	Sale information
V3	Represents	Sale information

- C1 is instantiated in
 - C1.1:C(eGov, Athens REA, T, non-discl(V1))
 - C1.2:C(eGov, Athens REA, T, non-discl(V3))
 - C1.3:C(Storage, Athens REA, T, non-discl(V1))
 - C1.4:C(Storage, Athens REA, T, non-discl(V3))

Example: Non-disclosure

SRS

Mapping

BPMN

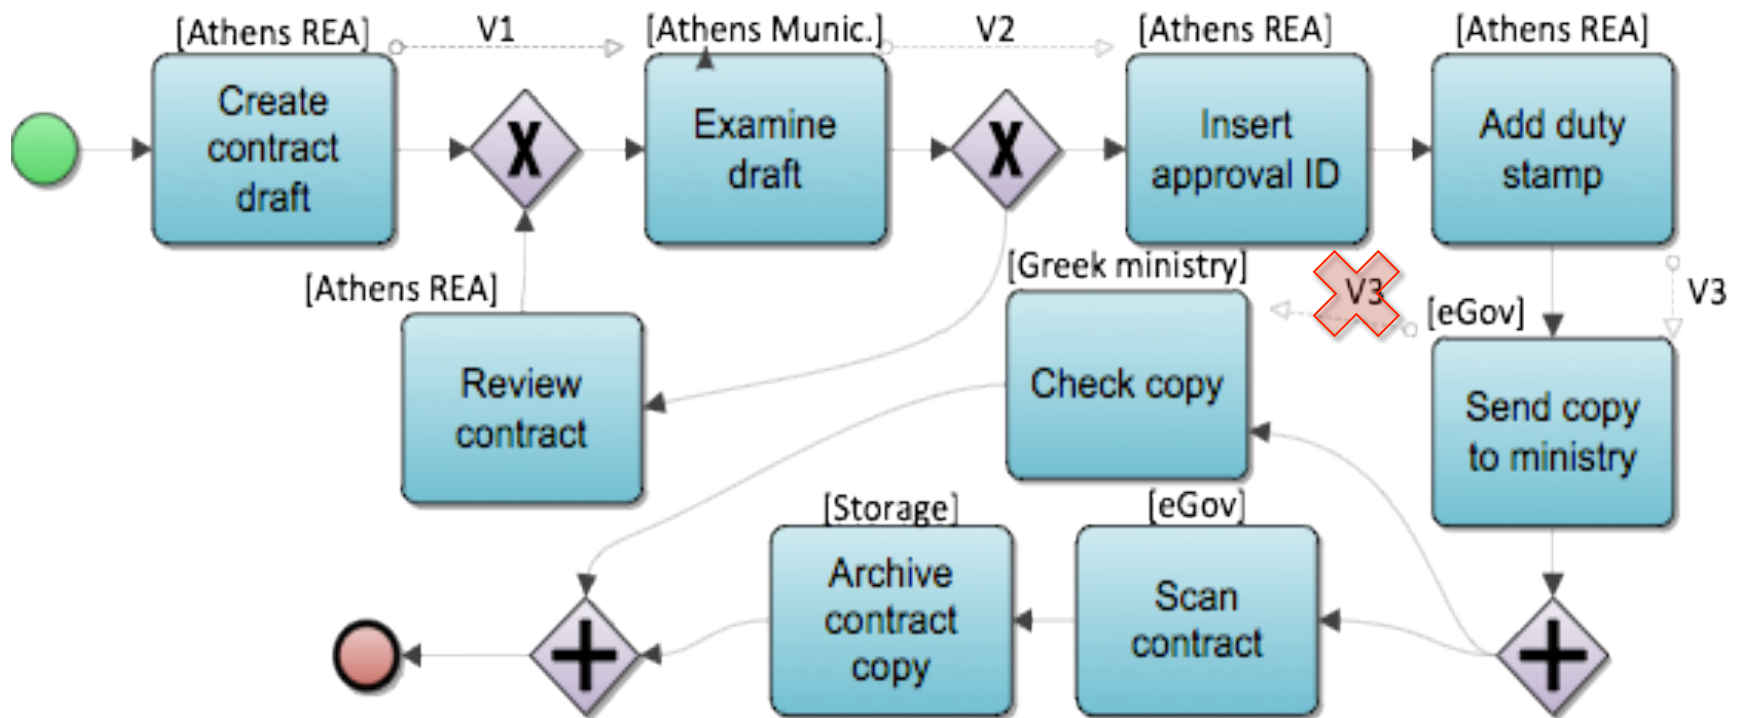

Algorithm 4 Non-Disclosure Verification

```
VERIFYND( $C(\text{deb}, \text{cred}, \top, \text{non-disc}(\text{var}))$ ,  $BP$ ,  $SRS$ ,  $CM$ )  
1  $\text{actByDeb} \leftarrow BP.ACTIVITIESBY(\text{deb})$   
2  $\text{actByCred} \leftarrow BP.ACTIVITIESBY(\text{cred})$   
3  $\text{actUsingVar} \leftarrow BP.ACTIVITIESUSING(\text{var})$   
4  $\text{doc} \leftarrow CM.SEARCH(\text{represents}(\text{var}, *))$   
5 if  $\text{doc} \neq \text{null}$   
6   then  $\text{info} \leftarrow SRS.SEARCH(\text{tangible-by}(*, \text{doc}))$   
7     for each  $i \in \text{info}$   
8       do  $\text{own} \leftarrow SRS.SEARCH(\text{owns}(*, i))$   
9          $\text{actByOwner.ADD}(BP.ACTIVITIESBY(\text{own}))$   
10  $\text{actByOthers} \leftarrow \text{actUsingVar} \setminus \text{actByDeb} \setminus \text{actByCred} \setminus \text{actByOwner}$   
11 for each  $a_i \in \text{actByDeb}$   
12 do for each  $a_j \in \text{actByOthers}$   
13   do if  $\text{var} \in \text{output}(a_i) \cap \text{input}(a_j)$   
14     then return non-compliant  
15 return compliant
```

Y/N

Example: Non-disclosure

C1.2:C(eGov, Athens REA, T, non-discl(V3)) ❌

Conclusions & future works

- We have proposed:
 - a methodological approach to check alignment between security requirements and service compositions in an evolutionary system
- Future works
 - Implementation (Aniketos)
 - Extension of supported Security requirements

THANK YOU
